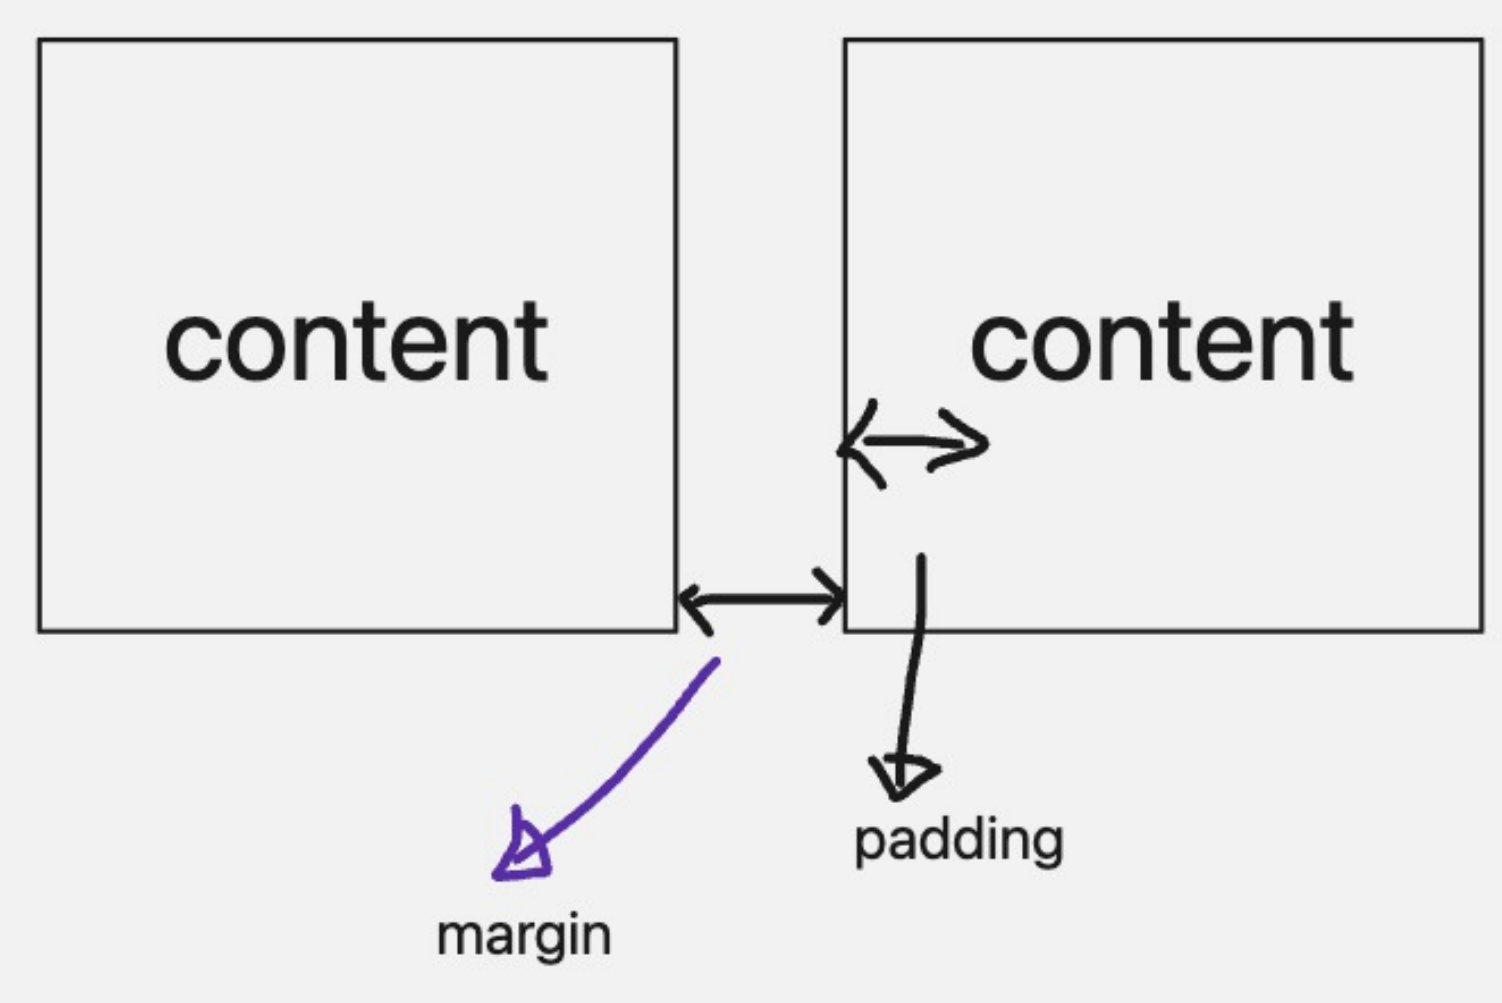
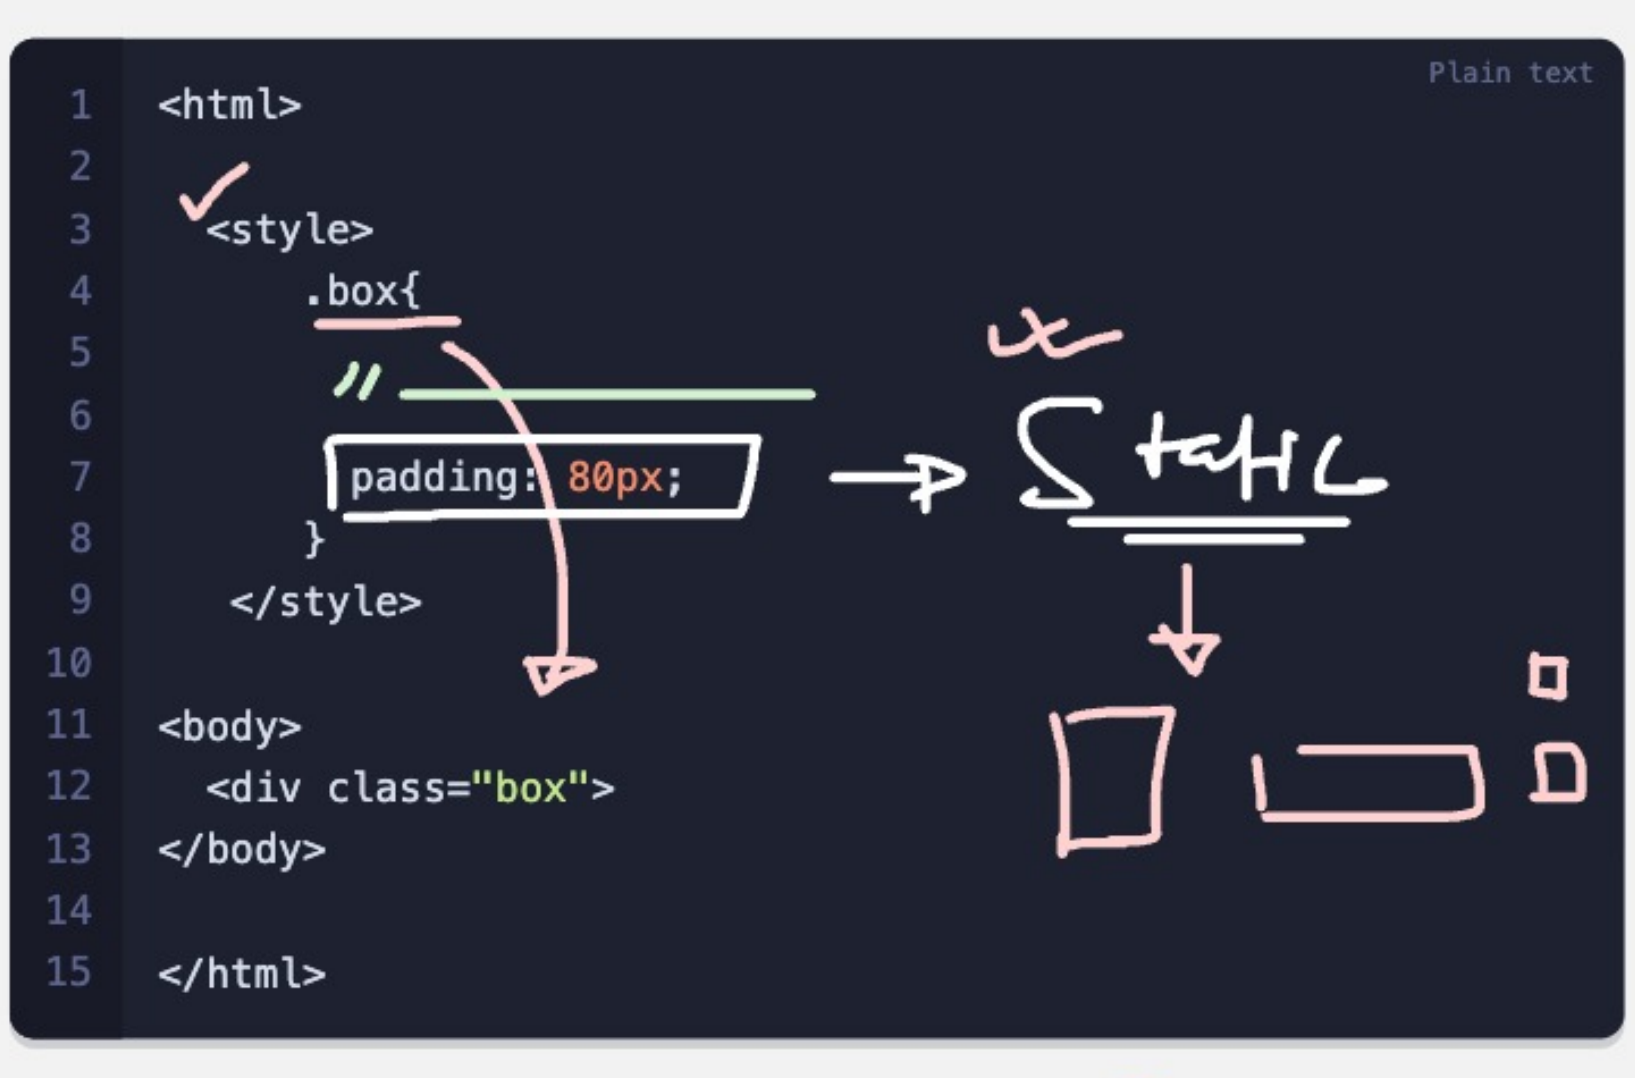
- z-index
- flex box

recap

html and css

css → padding and margin





```
<html>

  <style>
      .box{
        //

        padding: 80px;
      }
   </style>

<body>
  <div class="box">
</body>

</html>
```

Plain text

Static

ipad: 1090px..
laptop: 1090px..

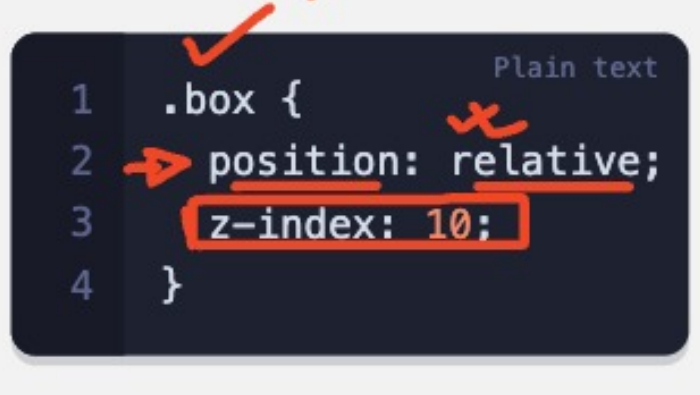
100px

20200px

Align content
%

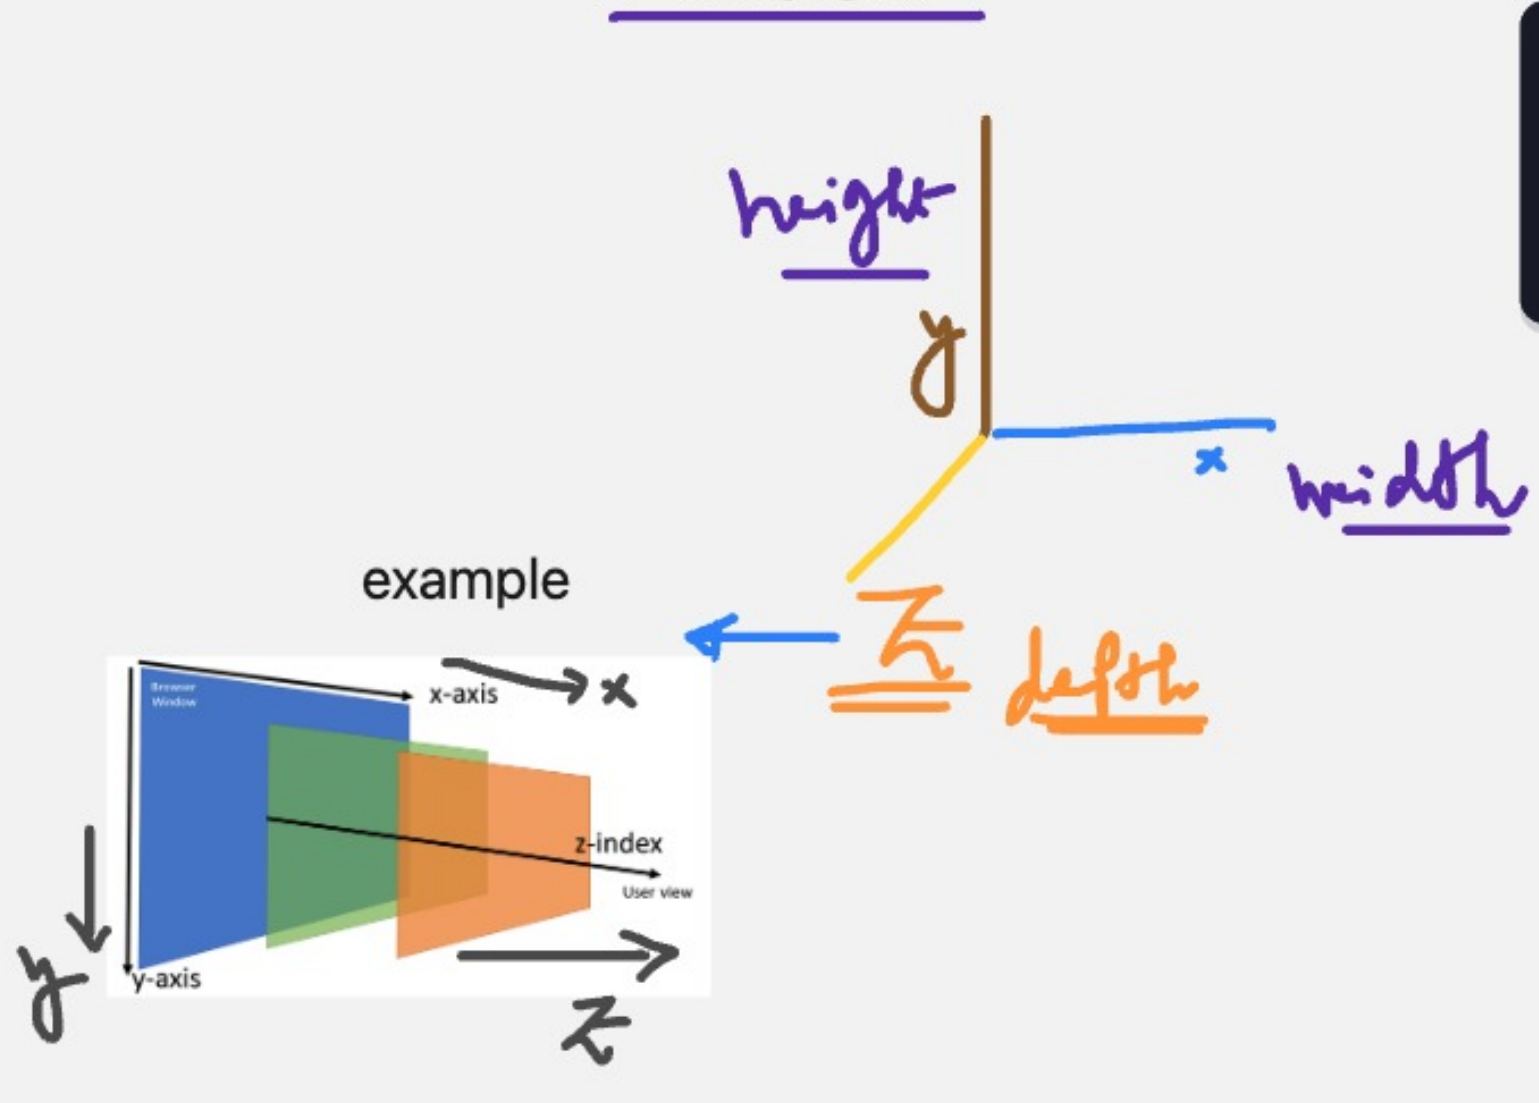
z-index

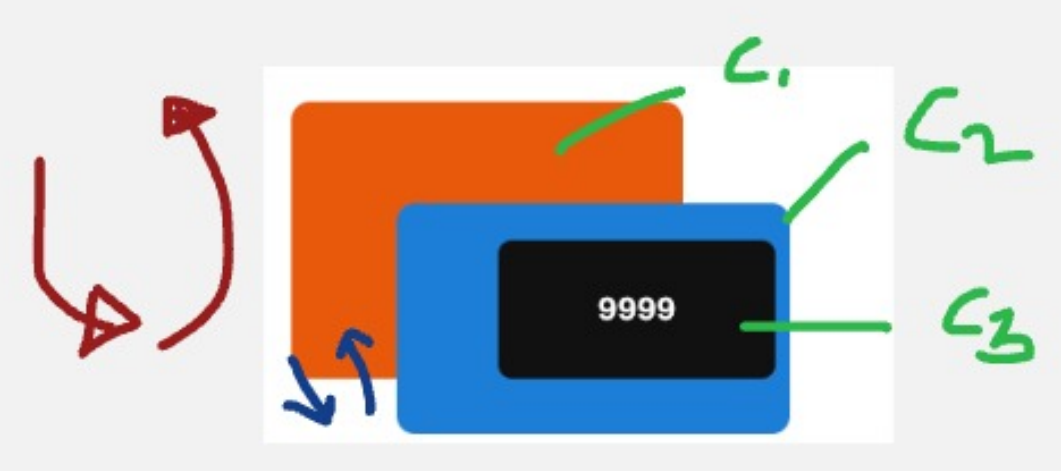
prop

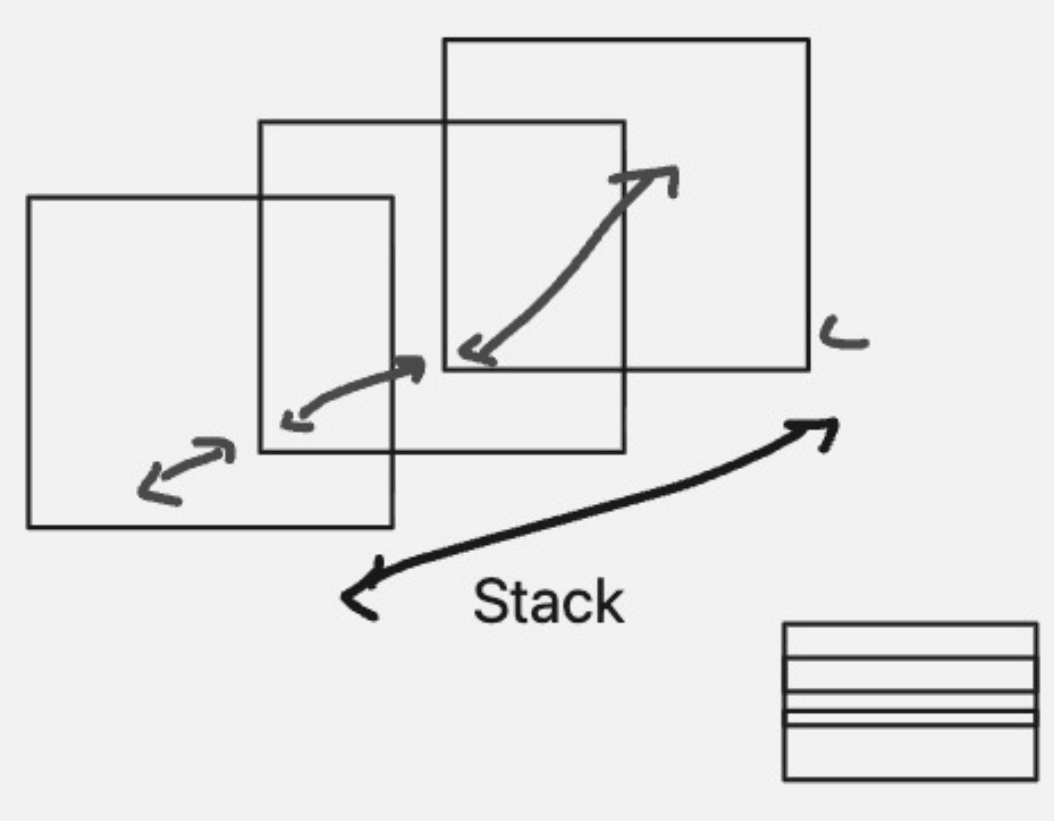


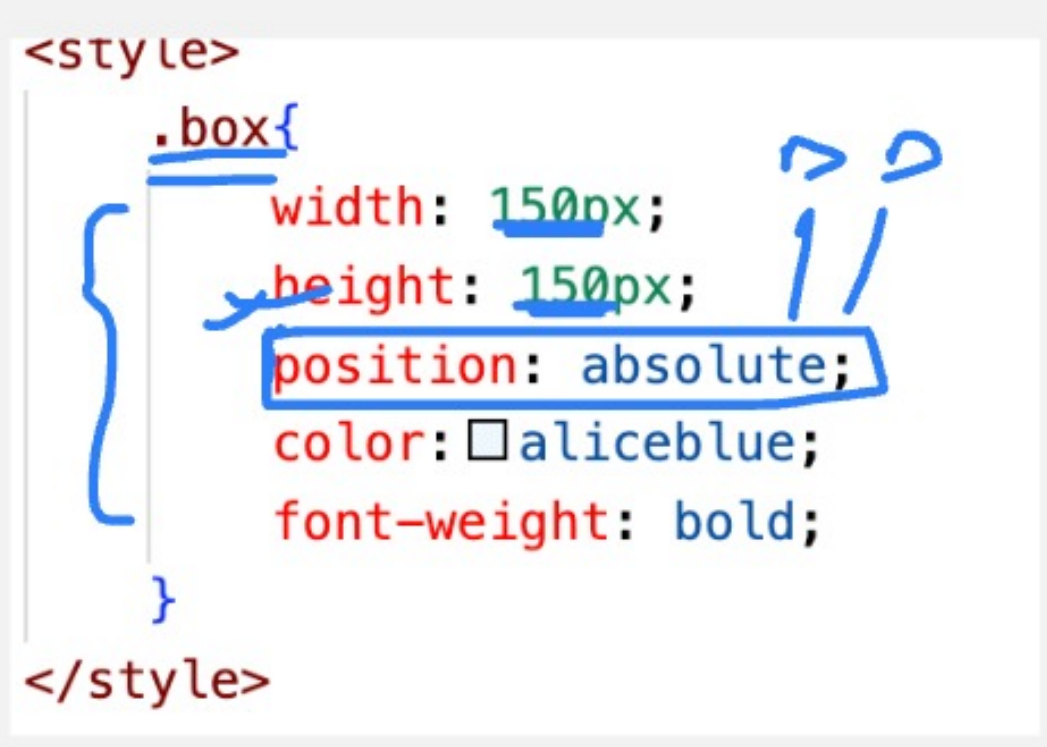
```
.box {
  position: relative;
  z-index: 10;
}
```

Plain text

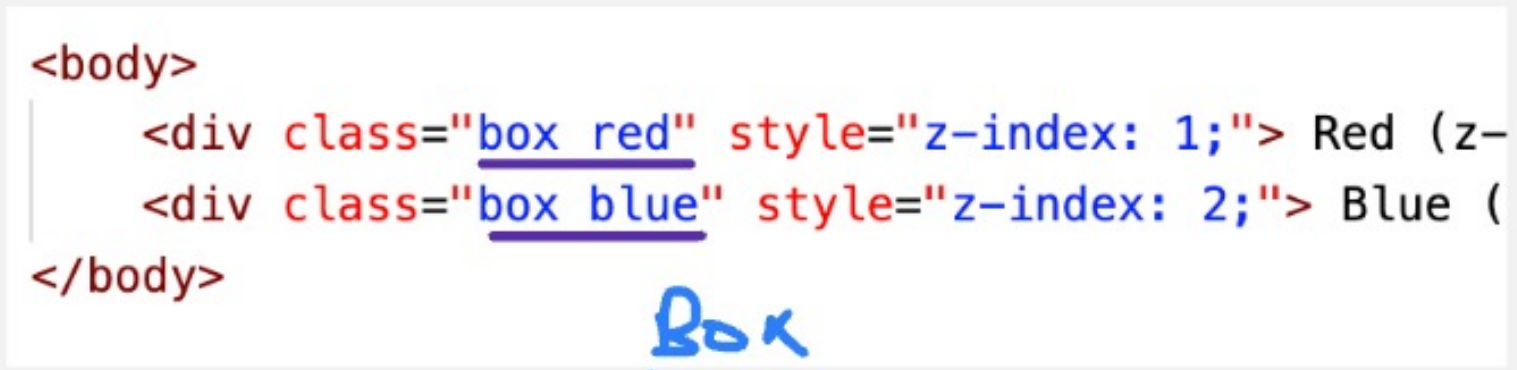




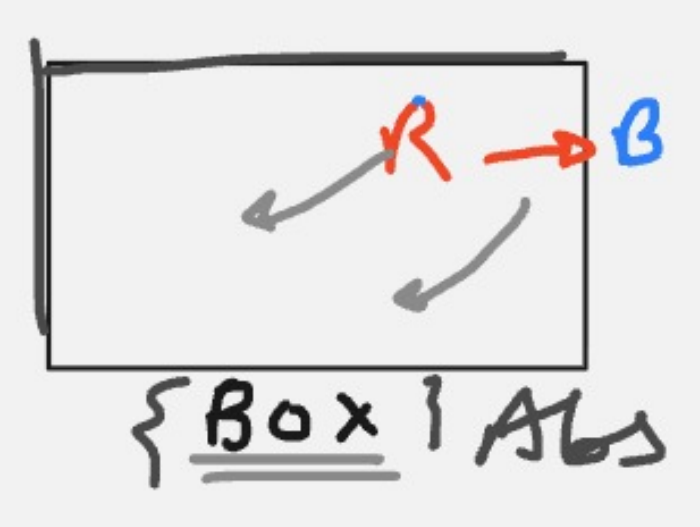


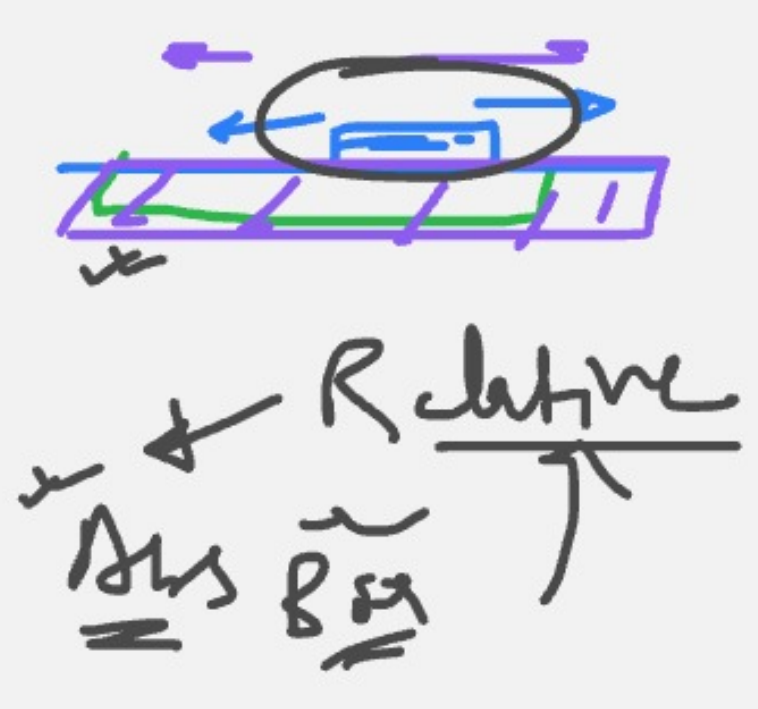


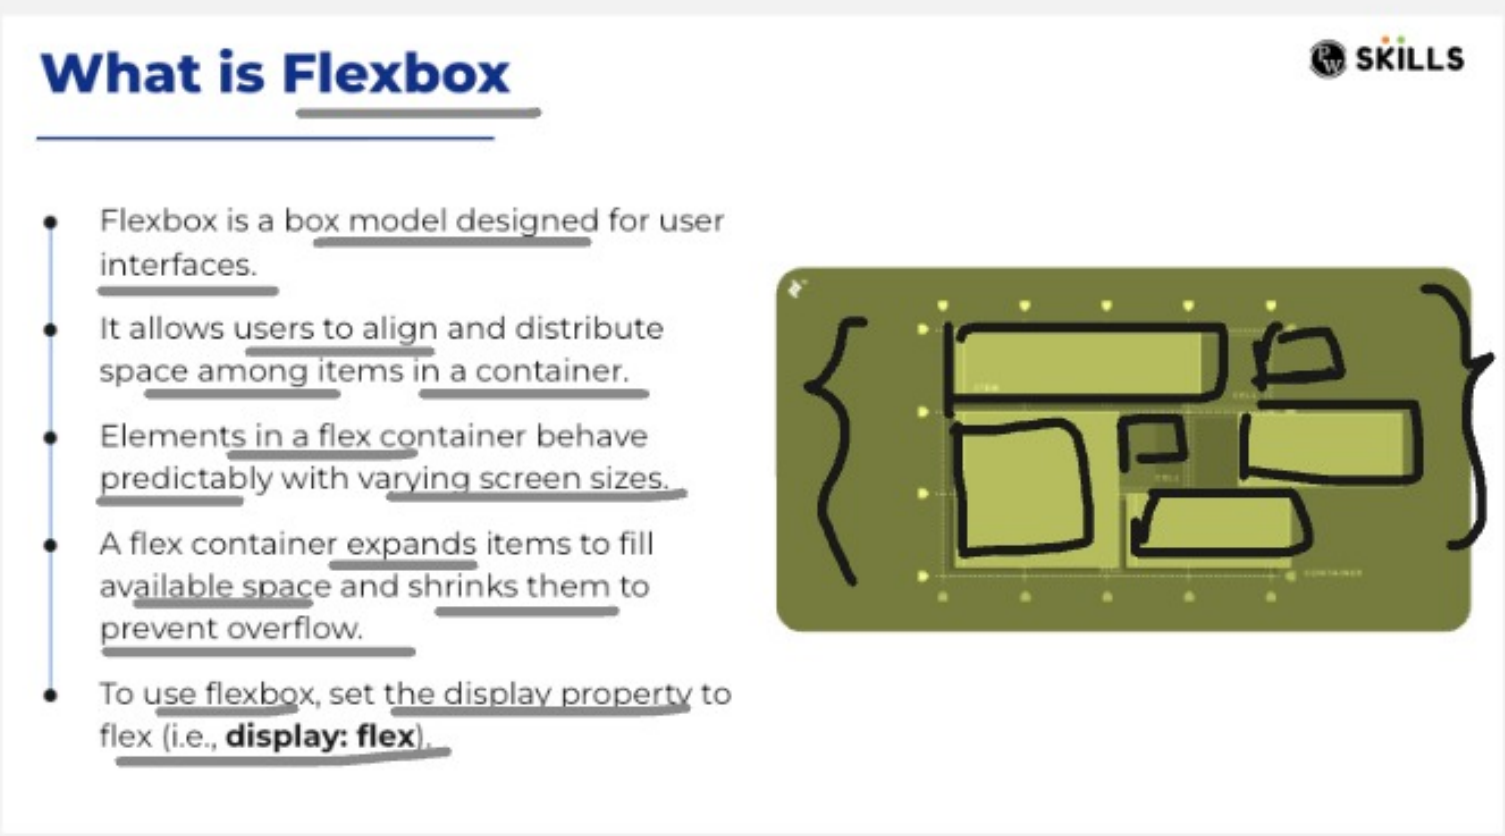
```
<style>
    .box{
        width: 150px;
        height: 150px;
        position: absolute;
        color: ☐aliceblue;
        font-weight: bold;
    }
</style>
```



```
<body>
    <div class="box red" style="z-index: 1;"> Red (z-
    <div class="box blue" style="z-index: 2;"> Blue (
</body>
```



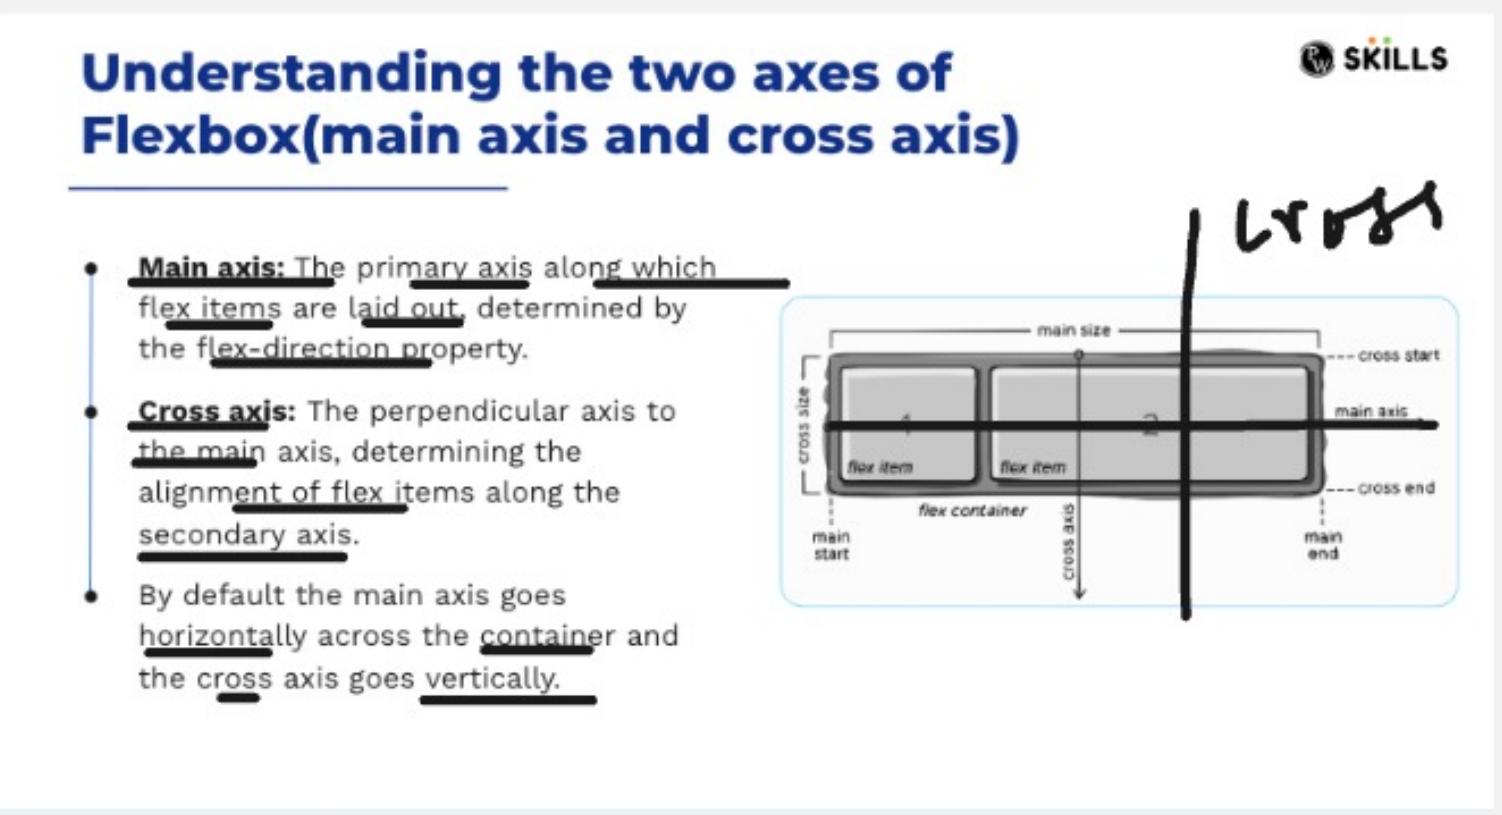




What is Flexbox

SKILLS

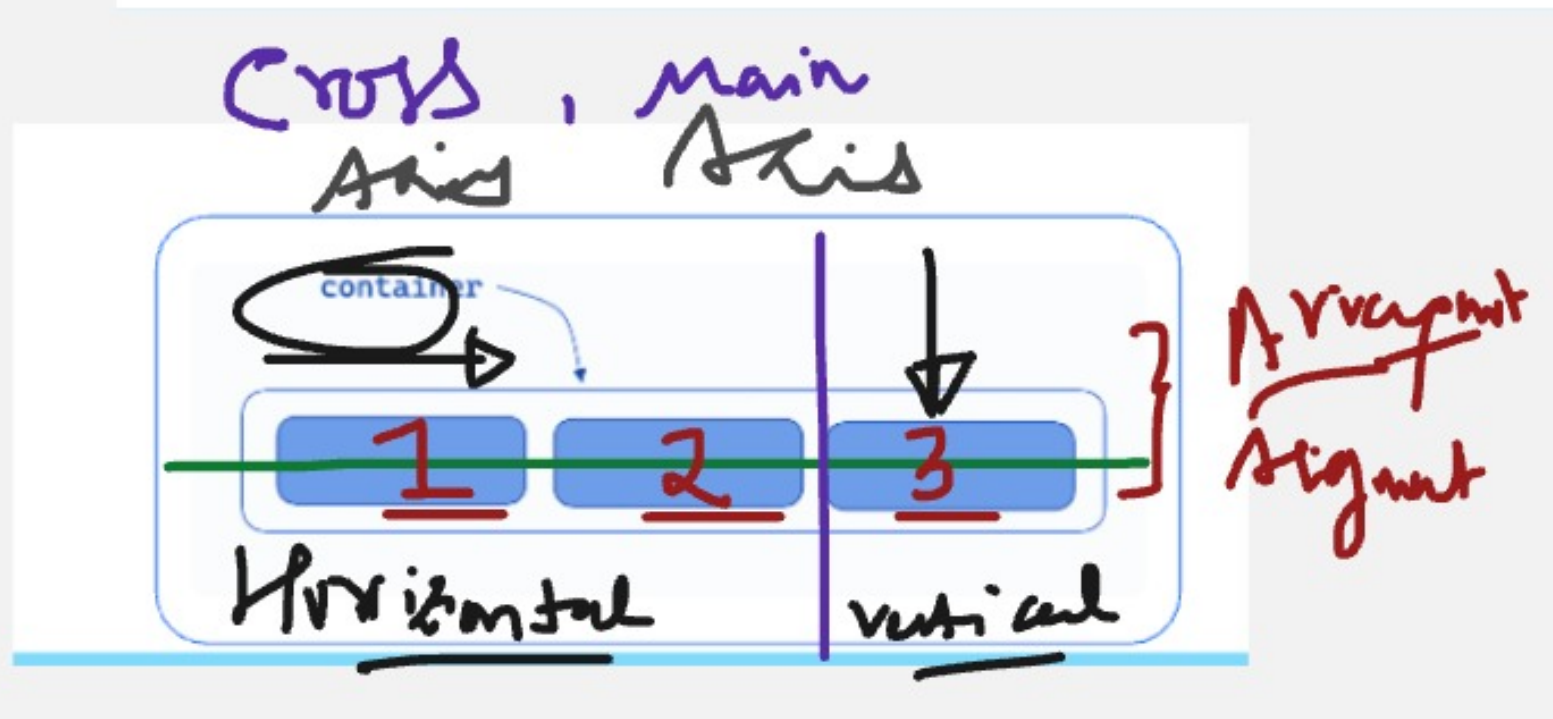
- Flexbox is a box model designed for user interfaces.
- It allows users to align and distribute space among items in a container.
- Elements in a flex container behave predictably with varying screen sizes.
- A flex container expands items to fill available space and shrinks them to prevent overflow.
- To use flexbox, set the display property to flex (i.e., **display: flex**).

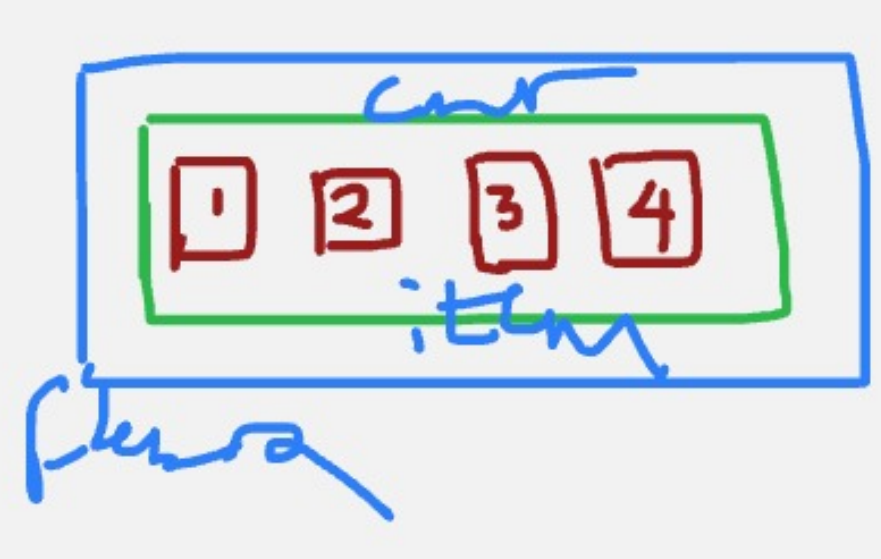


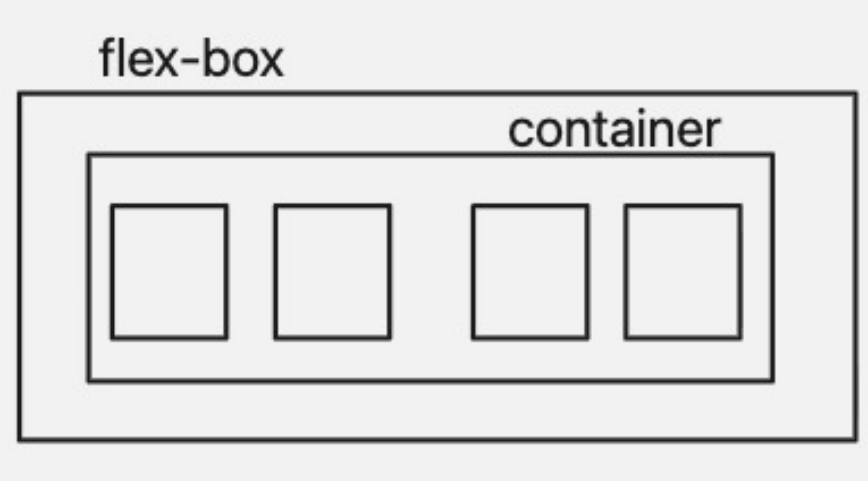
Understanding the two axes of Flexbox(main axis and cross axis)

SKILLS

- **Main axis:** The primary axis along which flex items are laid out, determined by the flex-direction property.
- **Cross axis:** The perpendicular axis to the main axis, determining the alignment of flex items along the secondary axis.
- By default the main axis goes horizontally across the container and the cross axis goes vertically.

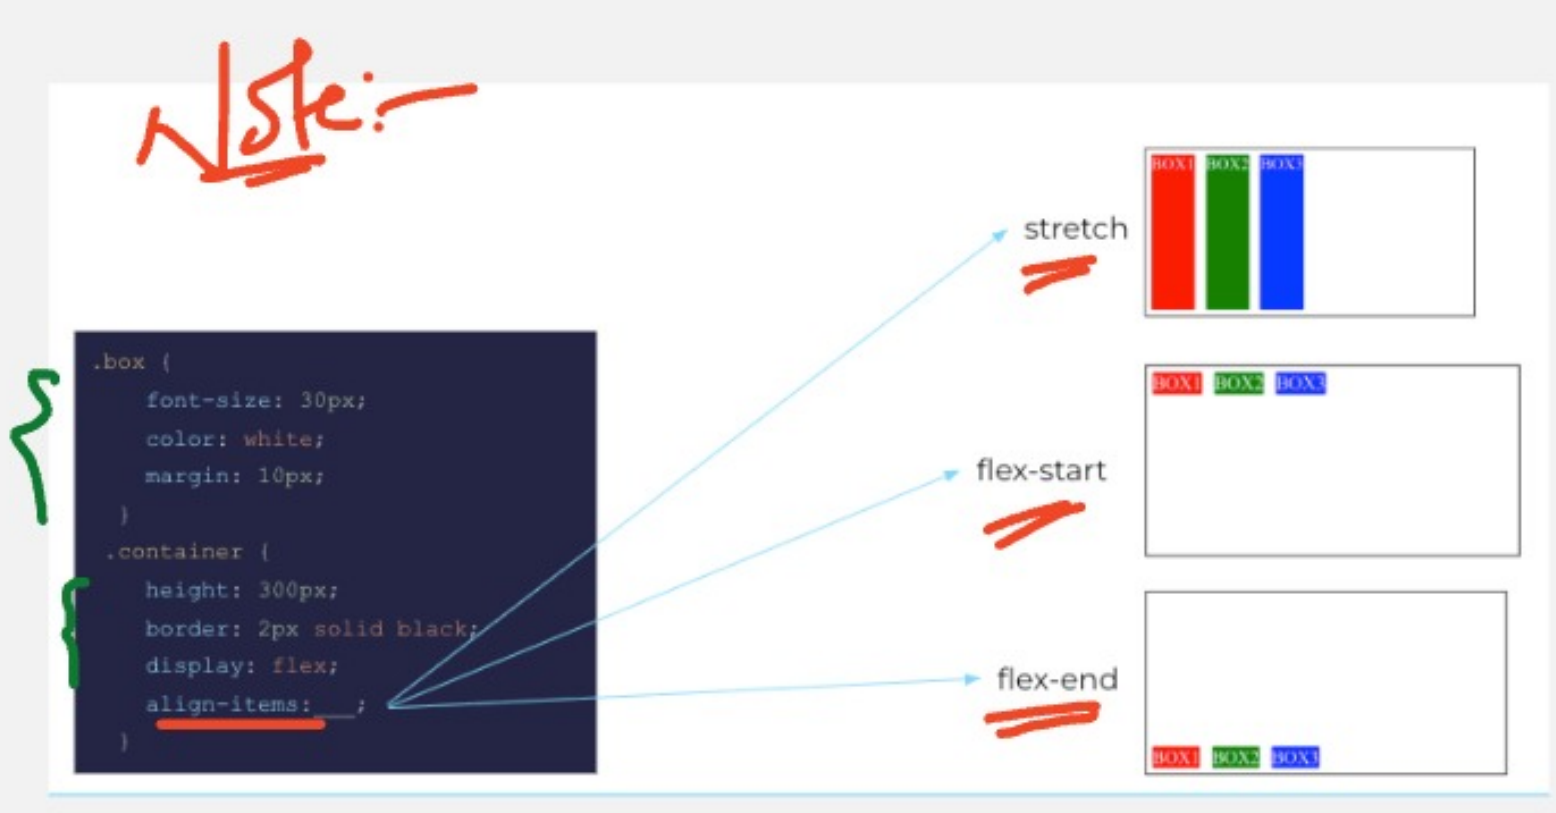






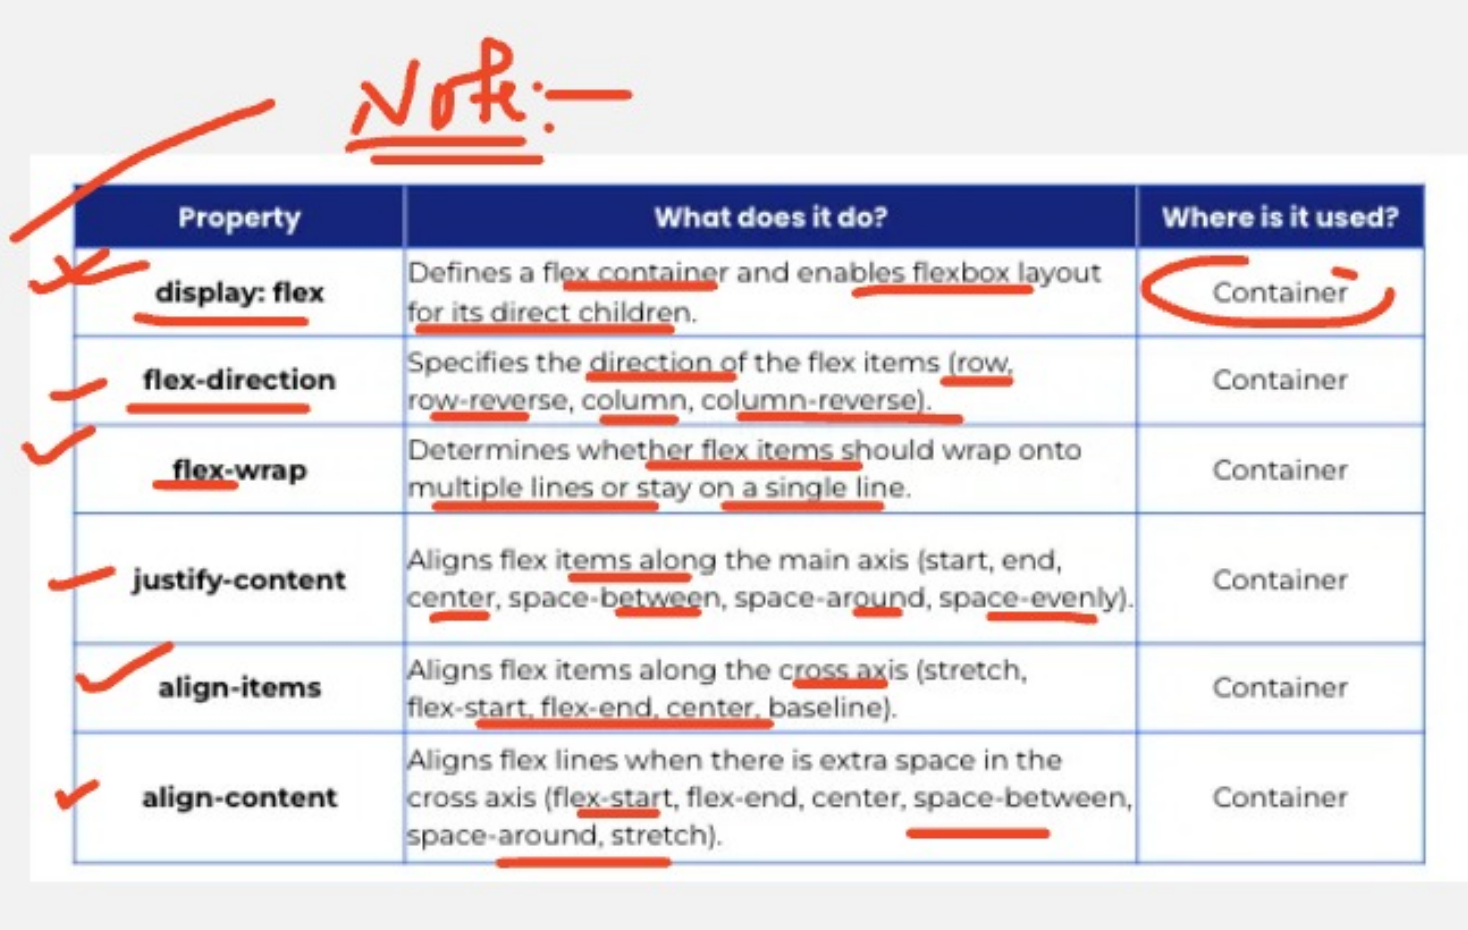
diff : relative adjustment

Note:-



```
.box {
    font-size: 30px;
    color: white;
    margin: 10px;
 }
 .container {
    height: 300px;
    border: 2px solid black;
    display: flex;
    align-items: ___;
 }
```

Note:-



Property	What does it do?	Where is it used?
display: flex	Defines a flex container and enables flexbox layout for its direct children.	Container
flex-direction	Specifies the direction of the flex items (row, row-reverse, column, column-reverse).	Container
flex-wrap	Determines whether flex items should wrap onto multiple lines or stay on a single line.	Container
justify-content	Aligns flex items along the main axis (start, end, center, space-between, space-around, space-evenly).	Container
align-items	Aligns flex items along the cross axis (stretch, flex-start, flex-end, center, baseline).	Container
align-content	Aligns flex lines when there is extra space in the cross axis (flex-start, flex-end, center, space-between, space-around, stretch).	Container
